

SEO & GEO Audit Dashboard

Portfolio case study. Self-built tool for SEO and AI search readiness auditing.

Ganendra Manggala Buono | Built and maintained independently | buonogane.github.io/seo-geo-audit-dashboard

PROBLEM

Manual SEO audits relied on scattered ScreamingFrog exports with no consolidated view and no severity-based prioritization. There was also no way to check whether the site was reachable by the AI systems increasingly involved in search discovery, such as AI Overviews, ChatGPT, Perplexity, and Claude. Reviewing more than 1,000 crawled URLs by hand in a spreadsheet was slow and error prone, especially during a full website relaunch, where missed issues could cost ranking visibility.

WHAT I BUILT

A browser-based SEO and GEO (Generative Engine Optimization) audit dashboard that turns a raw ScreamingFrog crawl export into a structured report in one step.

- **Health overview:** total URLs, status codes, redirects, schema and canonical coverage briefly.
- **Prioritized SEO checks:** issues automatically sorted into High and Medium priority, each filterable with one click.
- **GEO signals:** check whether AI crawlers such as GPTBot, Claude User, PerplexityBot, and Google Extended are blocked in robots.txt, and whether an llms.txt file is declared. This is a forward-looking layer most standard SEO tools do not cover.
- **Searchable URL table:** filters by status, indexability, and schema type, with CSV export.
- **One clicks PDF export:** for sharing results outside the tool.

RESULT

Reduced a multi-step manual export and compared workflow to a single upload and review action across more than 1,250 URLs. Used this tool to help maintain stable SEO visibility through the November 2025 site relaunch by catching technical issues early. It also extended the audit into AI search readiness, confirming the site declares llms.txt and stays crawlable by GPTBot, Claude User, PerplexityBot, and Google Extended, ahead of most standard SEO checklists.

1,251 URLs audited. 1,220 indexable. 100% of AI crawlers are unblocked.

Tools: ScreamingFrog, HTML/JavaScript (custom dashboard), GitHub Pages, robots.txt and llms.txt analysis

IN ACTION

A screenshot of a raw ScreamingFrog crawl export, showing a large, unprocessed table of data with many columns and rows of text.
